Growth Resilience (reanalisis)

AJ Perez-Luque ((???))

2017 Dec

Resilience

- Calcularemos las métricas resiliencia de (**???**) sobre el crecimiento.
- Vamos a calcularlas sobre el BAI de cada árbol.
- Utilizaremos tres sitios: SJ, CAH y CAL (ver ./analysis/analysis_chronologies.md)

Prepare data

- Leer datos `rwl` de SJ y CA
- Leer datos de diametros de los focal tree

```
machine <- 'ajpelu'
# machine <- 'ajpeluLap'
di <- paste0('/Users/', machine, '/Dropbox/phd/phd_repos/qpyr_dendro/', sep = '')

# sj
sj <- read.rwl(fname=paste0(di, '/data_raw/dendro_ring/sn_sanjuan/sn_sanjuan.rwl'), format="tucson")
```

```

## 59       SNB3001      1867    2016   0.01
## 60       SNB3002      1874    2016   0.01
```

```r
# Read diameters data
compete <- read.csv(file=paste0(di, '/data_raw/dendro_competence.csv'), header=TRUE, sep=',')
```

```r
source(paste0(di, 'script/R/rw_byTree.R'))
source(paste0(di, 'script/R/bai_piovesan.R'))
source(paste0(di, 'script/R/baiResilience.R'))
```

- Crear dataframes `rwl` por cada sitio CA_High, CA_Low, SJ_High. SJ_Low
- Lectura y preparación de datos de diámetro

```r
# Prepare Diameter data

# Compute diameter (mm)
compete <- compete %>%
  mutate(dn_mm = (perim_mm / pi))

# Change name focal according to loc
compete <- compete %>%
  mutate(id_focalLoc = stringr::str_replace_all(id_focal, c("A" = "SJ", "B" = "CA")))
```

```
# Get only focal trees, and only selected variables
ft <- compete %>%
  filter(sp=='Focal') %>%
  filter(id_focal!='Fresno') %>%
  dplyr::select(id_focal, id_focalLoc, loc, dn_mm, height_cm)

# Set levels of eleveation
ca_lowcode <- c(paste0('CA', str_pad(1:10, 2, pad='0')),
            paste0('CA', 26:30))
ca_highcode <- paste0('CA', 11:25)

ft <- ft %>%
  mutate(site = as.factor(
    ifelse(id_focalLoc %in% ca_lowcode, 'CAL',
           ifelse(id_focalLoc %in% ca_highcode, 'CAH', 'SJ'))))
```

Aggregate RW by tree

- Agregar valores medios de RW por site (obtenemos sj_tree / caL_tree, caH_tree)
- ver fun rw_byTree o utilizar treeMean (dplR)

```
# Remember snc = structure of core name SJ0101 (site | tree | core)
sj_tree <- rw_byTree(sj, snc =c(2,2,2), locname = 'SJ')
caL_tree <- rw_byTree(caL, snc =c(2,2,2), locname = 'CA')
caH_tree <- rw_byTree(caH, snc =c(2,2,2), locname = 'CA')
```

- Crear diferentes dataset de diametro por sitio

```
diam <- ft %>%
  mutate(diameter = dn_mm,
         id = id_focalLoc) %>%
  dplyr::select(id, diameter, site) %>%
  split(.$site)

d_caH <- diam$CAH[,c('id','diameter')]
d_caL <- diam$CAL[,c('id','diameter')]
d_sj <- diam$SJ[,c('id','diameter')]
```

Cómputo del BAI por site

- He construido una funcion para el computo del BAI, teniendo en cuenta la aproximación de (Piovesa et al. 2008). Es similar a `bai.out`

```
bai_sj <- bai_piovesan(rwdf = sj_tree, diam_df = d_sj)
bai_caH <- bai_piovesan(rwdf = caH_tree, diam_df = d_caH)
bai_caL <- bai_piovesan(rwdf = caL_tree, diam_df = d_caL)

# Set class to bai object
# Esto es para que funcionen algunas otras funciones de dplR
bais <- c('bai_sj', 'bai_caH', 'bai_caL')
```

```r
for (i in bais){
  aux <- get(i)

  class(aux) <- c('rwl', 'data.frame')

  assign(i, aux)
}
```

Resilience

- Computar métricas de resiliencia BAI para los tres sitios.
- Computar tres eventos climáticos: 1995, 2005, 2012
- Computar ventanas temporales: 2, 3 y 4

```r
# Drought years
dyears <- c(1995, 2005, 2012)

# SJ
res_4_sj <- baiResilience(bai_sj, event_years = dyears, window = 4)
res_3_sj <- baiResilience(bai_sj, event_years = dyears, window = 3)
res_2_sj <- baiResilience(bai_sj, event_years = dyears, window = 2)

# caL
res_4_caL <- baiResilience(bai_caL, event_years = dyears, window = 4)
res_3_caL <- baiResilience(bai_caL, event_years = dyears, window = 3)
res_2_caL <- baiResilience(bai_caL, event_years = dyears, window = 2)

# caH
res_4_caH <- baiResilience(bai_caH, event_years = dyears, window = 4)
res_3_caH <- baiResilience(bai_caH, event_years = dyears, window = 3)
res_2_caH <- baiResilience(bai_caH, event_years = dyears, window = 2)
```

Asumptions

- Explorar si se cumplen los supuestos de normalidad y homocedasticidad. Tenemos que comprobar que cada uno de los grupos son normales (1995,2005,2012; site: SJ, CaH, CaL; e interactions)

Normalidad

```
normtestA <- rbind(nrcA, nrtA, nrsA, nrrsA)
normtestA %>% pander()
```
